LEGENDARY DURABILITY

DACCO torque converters are manufactured in Cookeville, Tennessee, at the world's largest torque converter remanufacturing facility. These converters outperform the competition in the toughest environments because of our precision remanufacturing process – a process that undergoes continual improvement.

We have made significant investments not only in equipment, like hi-tech CNC Lathes, welders, and media blasters, but also in people and training. Our associates are actively engaged in suggesting and implementing improvements to our company based on their interactions with you – our valued customer.

All DACCO Torque Converters are built to the highest quality standards. Each converter goes through the following rigorous five-step process to ensure the highest level of quality:

CLEANING

All components are cleaned thoroughly prior to assembly. State of the art cleaning and media-blasting equipment is used to remove the smallest particles and the varnish that can accumulate on parts.

ASSEMBLY

Bills of Materials are established based on extensive research and analytics. Each converter is built to specifications that meet or exceed the OEM equivalent.

WELDING

OEM factory welding machines and technology are used to build a true converter with no leaks or inner contamination.

FINAL INSPECTION

Each converter is extensively tested for leaks, run out, end play, and balance. Detailed reports are recorded with the unique QR code for each converter.

QUALITY CONTROL

Overlapping stages of quality checks and processes ensure that the final product is the best converter on the market.

Every individual in Cookeville understands that the key to our success is YOUR success, and they work every day to make sure that they build a world-class torque converter so that you can send your customers down the road with confidence.

CONVERTER INSTALLATION

TRANSMISSION / TORQUE CONVERTER INSTALLATION

Any quality transmission repair is dependent upon several factors such as proper initial diagnosis, top quality replacement parts, and sound rebuilding practices and procedures.

Another important function of the process is installation or "R&R." The best remanufactured transmission/torque converter can be greatly affected or even destroyed by improper installation procedures.

As with rebuilding the transmission, there are installation basics which should be adhered to in order to avoid wasting time or having potential problems. Following are examples of installation basics:

1. Correct Identification

The technician must verify that the torque converter is the correct application, despite potential misboxing, order error, or lack of specific identifiers. Examples include:

- a. Spline Counts – AX4S 23/25 spline turbine shaft
- b. Hub Length – Honda hubs with pump gear splines
- c. Timing Marks – Chrysler with ignition timing mark
- d. Stall Speed – Various models which have impeller dimples
- e. Lockup Piston Lining – GM On/Off vs. PWM vs. EC3 strategy
- f. Pilot Type – Toyota/Ford diameter, length, or style
- g. Balance – Chrysler with counterbalance weights
- h. Damper Design – Ford single/twin disc, and damper spring capacity
- i. Bolt/Nut Threads – Various applications using standard/metric, fine/coarse

There are several variables beyond what is listed, so be diligent.

2. Sealing Component

There is a variety of sealing components used on transmission input shafts/stator supports for lockup applications. Whether the item is an o-ring or Teflon sealing ring, the size must be correct. Honda, for instance, uses an o-ring on the impeller hub and size can vary from model to model. The o-ring cross section is as important as the diameter.

Material is another concern due to the heat that a torque converter can generate. The wrong material will take a heat set and lose all sealing capability, which will cause lockup problems.

3. Crankshaft Pilot

Before inserting the torque converter into the transmission, verify that the fit between the torque converter pilot and crankshaft pilot bore is correct by placing the torque converter in position and checking for proper clearance. Certain vehicles, such as Ford's A4LD family, have removable crank pilots which tend to wear and should be replaced.

4. Alignment

All applications use some means to properly align the engine and transmission. Normally this is accomplished by the use of dowel pins. At times, when a transmission is removed, one or both dowel pins stick to the transmission and do not remain with the engine. The replacement transmission will not contain the dowels and once re-installed, misalignment will occur.

Bell housing bolts themselves align nothing.

Another issue is that, at times, the dowel pin holes in the transmission housing can be worn which will also result in misalignment. Always ensure that both dowel pins are there, that the corresponding holes are not worn, and that there are no other obstructions to proper engine/transmission alignment.

Lastly, applications like the 5R55W/N which use a dual plate design (1 flex plate, 1 flywheel) do require an alignment tool for proper installation. Not using this tool can cause various problems as well.

5. Clearances

Once the transmission is bolted to the engine, the torque converter mounting pad to flex plate clearance must be checked. Proper clearance is important for a couple of reasons. Too little clearance will put undue load on pump gears or the crankshaft thrust bearing, based upon design. Too much clearance will not allow enough engagement of the hub drivers into the pump gear or drive splines, resulting in gear breakage or stripped splines.

Incorrect clearance can be the result of improper torque converter stack height, incorrect flex plate/flywheel, improper pump gear position, etc. Clearances less than 1/8" or more than 3/16" should be scrutinized.

Torque converter clearances can be checked even on applications having a full round bell housing.

6. Attachment

A torque converter is attached to the flex plate/flywheel by either bolts or nuts. Beyond the initial question of whether they are standard or metric thread is the question of pitch, which could be fine or coarse.

An important factor is length. Using a bolt which is too long can damage the torque converter cover, especially on lockup types. The bolt can dimple the machined surface of the cover where the lockup piston lining makes contact, resulting in lockup issues. Therefore, be aware of the mounting pad thickness.

HOW TO MEASURE

GLOSSARY

OF TERMS

TERM	DEFINITION
Bolt Circle Diameter	The measurement between two mounting points (bolt holes or studs) that are 180 degrees opposed. NOTE: Always measure from center to center.
Bolt Pattern - 90°	Typically refers to 4 pad Chrysler converters with pads equally spaced in relation to one another. The distance (center to center) is the same when measuring adjacent pads
Bolt Pattern - Offset	Typically refers to 4 pad Chrysler converters with pads NOT equally spaced in relation to one another. The distance (center to center) is DIFFERENT when measuring adjacent pads
Bolt Circle Radius	The measurement between the center of one mounting point (bolt hole or stud) and the center of the pilot. Bolt Circle Radius x 2 equals Bolt Circle Diameter.
Brazing	The practice of reinforcing fins in either the primary (impeller) or the turbine. Brazing can be done manually with a TIG welder, or can be done via a method where components are placed in a special oven or furnace.
Coast Relief Valve	a.k.a. Poppet Valve. Pressure relief mechanism in converter to release TCC (torque converter clutch) while coasting.
Cover	a.k.a. front cover. The half of the converter outer shell that mounts to the engine drive plate. The cover typically has the pilot and mount pads (or studs) incorporated into it.
Diameter, Overall	The largest width measurement of the converter not including a ring gear, mount ring or inertia ring if attached.
Elliptical	Low profile oval shaped converter
End Play	Internal component clearance measurement. Not the same as clutch clearance.
Fin Angle	Typically refers to the angle of the dimples or ribs on the exterior of the impeller (primary). Fin Angle is one variable that controls the stall speed of the converter.
Friction Material - LCC	Paper with Low Carbon Content (Only a small percent is carbon)
Friction Material - Paper	Paper (Organic, Cellulose Based)
Friction Material - WC	Woven Carbon (100% Carbon)
Hub	Component of the converter that inserts into the pump of the transmission. Hubs may or may not have flats, slots or ears that are used to drive the transmission pump, depending on application.
Impact Gun	Pneumatic tool typically used by mechanics to quickly tighten or loosen fastening nuts or bolts. NOTE: never use an impact gun to fasten converters to engine drive plates.
Impeller	a.k.a. Primary. Half of the converter outer shell that has curved fins/blades attached to the inside. The impeller is the driving member of the converter. Typically, the converter hub is incorporated into the impeller half of the unit.
Input Splines	The splines on the input shaft that connect to the converter driven member (Turbine)
Lock Up	Term used to describe converter function where a friction element inside the converter is hydraulically applied so that a direct and mechanical link is made between the engine and transmission.
Lock Up - Captive Clutch	Type of clutch pack lock up that has inaccessible friction components due to unique and proprietary OE designs. Typically found in ZF 5HP19 and 5HP24 converters.
Lock Up - Centrifugal	Type of lock up that is achieved and controlled by centrifugal force within the converter. This type of lock up function is not controlled electronically or hydraulically.
Lock Up - Clutch Pack	Type of lock up that uses a clutch pack similar to clutch drums found in the transmission. Friction and steel plates are serviceable and held in place with a snap ring.

TERM	DEFINITION
Lock Up - Clutch Piston	Most common type of lock up. Uses a single spring dampened piston and a single friction element.
Lock Up - Damper Drive	Type of lock up where a clutch pack in the transmission is driven by an independent shaft that is splined into a spring dampened drive plate that is fastened to the inside of the converter cover
Lock Up - Multi Friction Clutch	Type of clutch piston lock up that uses more than one friction element
Lock Up - On / Off	Term used to describe characteristics of lock up control. On / Off indicates that the friction elements in the converter are either fully applied, or fully released. Application does not call for the converter clutch to be partially slipped
Lock Up - PWM	Type of lock up control that allows the converter clutch to partially slip during normal operation. "PWM" refers to Pulse Width Modulation. A PWM system typically incorporates valve body, solenoid and software components that can pulse (as opposed to simply turn off) release oil to the converter clutch assembly. Converter clutches can be slipped very briefly or over extended periods of time, depending upon application. Different OEMs use different techniques in different applications; therefore not all PWM systems are the same. Typically, the converter clutch assembly is calibrated to the type of PWM system that is used in a specific application. Mismatching non PWM torque converters into PWM equipped applications (and vice versa) can cause drivability problems and premature failure.
ECCC (EC3, EC³)	Electronic Converter Clutch Control (ECCC) is a proprietary type of PWM control of the converter clutch that was introduced by General Motors into some applications as early as 1996. ECCC (also know as EC3 or EC ³) strategy can continuously slip the converter clutch for very long periods of driving. ECCC typically requires use of woven carbon (or equivalent) friction material that can endure the heat generated by this style of PWM. The most reliable way to determine if a vehicle uses ECCC strategy is to connect a scan tool to the vehicle and monitor the method by which lock up is applied.
Pads, Lugs, Studs	Types of ways that the converter can be attached to the engine flex plate or flywheel.
PCM	Power Control Module. Can also be referred to as TCM, ECM, VCM, TEHCM, or simply the computer. Hardware and software that controls electronic functions of the transmission in 'computer controlled' applications.
Pilot	The part of the cover that is inserted into the engine crankshaft when installing a torque converter,
Overall Converter Height	Measured from the leading edge of the hub to the surface of the converter that sits against the flex plate.
Run Out	Measurement of converter components as they deviate from centerline. Typically, run out is measured from pilot to hub, and is recorded as "TIR" (total indicated run out). There are many variables and methods used to measure run out, and different methods will produce different results
Stall Speed	Hypothetical maximum engine RPM measurement with the input shaft of the transmission locked in place. This is how fast the engine can spin the outside shell of the converter with the inner turbine locked in place. Stall speed is dependent upon the power characteristic of the engine that is driving the torque converter. The same converter will have a different stall speed when placed behind different engines.
Stator	Component of the torque converter that is separate and independent from the outer shell of the converter. When installed on the transmission, the stator is splined onto stator support splines. Stator typically contains a roller clutch or sprag assembly that allows one way rotation.
Stator Support	Stationary splines in the transmission that supports the stator inside of the converter.
Turbine	Component of the torque converter that is separate and independent from the outer shell of the converter. The turbine is the driven member of the converter that is splined to the input shaft of the transmission.
Weights (Converter)	Converter balance weights: Balance weights attached to the converter that are in place to balance the torque converter. These smaller weights are typically between 5 and 20 grams
Weights (Engine Balance)	Engine counter balance weights: Balance weights attached to the converter that are in place to balance the engine crankshaft. These larger weights are typically between 60 and 120 grams

LIMITED WARRANTY

All Dacco by Transtar Torque Converters supplied are warranted to be free from manufacturing defects in material and workmanship for a period of 3 years or 36,000 miles from the date of purchase, whichever occurs first. This warranty is void, and no warranty shall apply to products that have been altered, improperly installed, maintained, or repaired; contaminated with oil or grease; damaged as a result of overheating, by accident, negligence, misuse, race or off-road use; or any other unauthorized use.

The above warranty is exclusive and in lieu of any other express or implied warranty of merchantability, fitness for a particular purpose or other warranties of quality, guarantees or representations, whether express or implied, except the warranty of title. Further, all express or implied warranties with respect to the product sold are limited to the duration of this warranty or the warranty of any third-party customer, supplier, dealer, jobber, provider, manufacturer, or distributor of such product supplied hereunder, whichever is less, and specifically does not exceed and/or replace any such third-party warranty.

Any and all parts returned to Transtar for warranty claim must be returned through the customer, dealer, jobber, provider, or distributor from whom it was purchased, in accordance with applicable policy and procedure, with a written explanation of how the part(s) were installed and operated. Transtar reserves the right to inspect and examine all parts returned for warranty claim to determine whether or not any such part has failed because of a defect in material or workmanship. The obligation under this warranty shall be strictly limited to replacing or crediting, at Transtar's option, any part found to be so defective. This warranty excludes, and Transtar shall not be liable for, any labor charges or other special, punitive, incidental, exemplary or consequential damages (including without limitation, lost revenues or profits), regardless of whether such damages were foreseeable and whether or not Transtar was advised of the possibility of such damages. In no event shall Transtar's aggregate liability exceed the total amount paid to Transtar with respect to the product sold. The above sets forth Transtar's sole liability and entire obligation, and the exclusive remedy for any action that is brought against Transtar.
